Methodology

Security scan (Step 2.5): Two-model parallel approach. Model A — GPT-OSS-20b at 192.168.8.147:1234 (Botbox2): static per-file security review using a 6-thread worker pattern. Model B — MiniMax + local grep sweep: regex/heuristic pass over all source files. Vulnerability classes scanned: SQLi, XSS, CSRF, IDOR,

AuthBypass, HardcodedSecret, SessionHardening, FileUpload/PathTraversal, TimingAttack, Cron/TOCTOU, InfoDisclosure, InsecureDeserialization, OpenRedirect, MissingRateLimit, CORS/OriginCheck, HeaderInjection.

Performance scan (Step 2.6): Same two-model pattern. Classes scanned: N+1, MissingIndex, UnboundedResultSet, SyncExternalCall, MissingCache, AssetBloat, RenderBlocking, ExcessiveDOM, MemoryHotPath, ResourceLeaks, CronInefficiency, ColdStart, FrontendRuntime, NetworkPayload, ConnectionPool, Concurrency.

UI/UX scan (Step 2.7): Same two-model pattern plus Playwright screenshot review where available. Classes scanned: a11y, FormUX, LoadingStates, ErrorUX, InformationArchitecture, VisualConsistency, ResponsiveDesign, i18n, StateFeedback, Discoverability, NativeDialog, DataBinding, DeadUI, ColorContrast, Microcopy, Motion, PrintExport.

Severity scale: Critical (direct exploit / unusability) → High (realistic exploit / visible breakage) → Medium (preconditions / tolerable lag) → Low (defense-in-depth / polish).

Scope rule (CRITICAL): *install/*, *e2e/*, and *tests/* directories are excluded from live-code audit scope. They are development-only and must never reach production. These folders should be manually deleted before any upload.

Security Findings
